

Rectification Summary

What changed, and why - YKS 2.0

Partner review (Ologos: JD & Micah Longmire) flagged that YKS 2.0 discovery was structured ad-hoc versus the systematic aide-canon corpus. This is the complaint-by-complaint before/after.

What they flagged → what we did

Flagged	Before	After
"Not the same file structure"	01 artifacts / execute / intake flat layout	1/2/3 baselines + decisions/ + canon/ + tools (aide-canon shape) - ADR-0001
"Decisions is where the ADRs live"	No ADRs; decisions buried in commits/prose	decisions/ with 13 ADRs (ADR-YKS-0001..0013), append-only, your template + index
"Read all the MxM files"	YKS ran 4M, unnamed	NOMOS re-spec'd as six-surface MxM (5M+1: +MEMORY +METHODS); bracket + graduation pipeline - ADR-0010
"Less vibe, more systematics"	Doctrine docs, no decision provenance	Every doctrine restated as a citable ADR; every canon artifact carries its ratifying-ADR reference
"Federal will expect this"	No conformance/construct vocabulary	Aligned to aide-canon constructs (MxM/AICP/OAgents); conformance + schema + PLM + skills ADR-adopted

The diff, rectified

Of 24 deltas + the process gap: **15 RECTIFIED, 5 ALIGNED, 4 RETAINED-YKS (by design), 1 MOAT, 0 OPEN.** Where ologos led, YKS 2.0 now adopts it and records the adoption as an ADR. What remains different is deliberate strength or the unique custody/freshness substrate (FUNDAMENTUM).

Clean-room

Only public ologos material informed this (aide-canon, CC BY 4.0). ng-aide-01 and ologos-recovery stayed hard-excluded (ADR-YKS-0006).
